Submitted (NB-SEP-2000) Genoscope - Centre National de Sequencage, 2 rue Gaston Cremieux, CP 5706, 91057 EVRY cedex, FRANCE. (E-mail: seqrefégenoscope.cns.fr)
This STS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces extaguus, Saccharomyces servazzii, Zygosaccharomyces rouxii, Saccharomyces servazzii, Zygosaccharomyces rouxii, Lactis var. lactis, Kluyveromyces thermotolerans, Kluyveromyces lactis var. lactis, Lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See the other extremity of this insert.

The present sequence represents a PCR primer for a geranylgeranyl action diphosphate (GGPP) synthase protein. GGPP synthase has cytostatic activity. A vector encoding GGPP synthase is useful in increasing GGPP synthase levels in a host cell preferably Taxus (Yew) cell and thereby facilitates production, isolation and purification of larger amounts of GGPP synthase is useful in obtaining expression or enhanced expression of GGPP and other diterpenes, such as paciltaxel, useful as anticancer drugs. Isolated nucleic acids encoding GGPP synthase encoding nucleic acids are used for identifying genes encoding GGPP synthase from microorganisms such as Taxomyces andreanae and Penicillium raistrickii.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This clone is contained in a DNA construct used to transform host plant cells for regulating the prodn. of the enzyme encoded by pTOM36. Plants such as apple, tomato and mango may be modified to produce e.g. sweeter fruit, novel flavour, modified colour or to have improved processing characteristics. The DNA construct pref. also comprises a constitutive or regulatory promoter, e.g. the CaMV 35S or poly-

Nucleotide sequence of the fiber protein encoded by adenovirus Ad-36p.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This is the nucleotide sequence encoding the adenovirus Ad-36p fiber protein used in the method of the invention to determine if a person is suffering viral obesity. The method is used to determine whether obesity in a person has a viral basis, Ad-36p can be used as a basis of a vaccine to prevent viral-based obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                       Determining if obesity in a person is caused by Ad-36 virus - and providing the basis for treatment or prevention of obesity-causing, cholesterol reducing adenovirus, using the purified variant, Ad-36p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence is that of the CDNA clone pTOM36 which is believed to encode a cytoplasmic protein of approximately 52000 daltons involved in the ribening of tomatces. The clone is 1069 bases long with an open reading frame of 271 codons. DNA homologous to pTOM36 may be used in a construct that inhibits expression of genes homologous to pTOM36 during ripening. Fruit from plants transformed with this construct have increased solids content and a higher content of reducing sugars, e.g. glucose and fructose. The fruit may be mangoes, peaches, apples, pears, strawberries, bananas, melons and esp. tomatoes, which are useful in the prodn. of

alcohol acyl transferase, alcohol dehydrogenase, pyruvate decarboxylase, aminotransferase and esterase activities, which are involved in the biosynthetic pathway for allohal dehydrogenase, pyruvate decarboxylase, aminotransferase and esterase activities, which are involved in the biosynthetic pathway for allohalts and/or aromatic ester production in fruit. The nuclectide sequences can be inserted into the genome of a fruit-producing plant to regulate aliphatic and/or aromatic ester formation. Aromatic and/or aliphatic esters in microorganisms, plant cansferase are produced by inserting thiolase, alcohol acyl ransferase and esterase nuclectide sequences into the genome and feeding the microorganism or plant with alcohol, aldehydes, alpha-keto acids, or amino acids and fatty acids, and acyl-CoA. The nuclectides and their proteins can be used in the processed food industry as food additives to enhance the flavour of syrups, ice-creams, frozen desserts, yoghurts and confectionery. They are used: as flavouring agents for oral medications and vitamins; provide flavour and aroma in beverages, including alcohol; enhance or reduce fruit flavour, aroma, fragrance or scent; enhance the flavour or aroma of natural, synthetic or artificial ground and accompances; as antifactal or antifundant alcohol; and or antificial flavour, and subjects as antifactal or antifundant accompances. perfumes in cosmetics, creams, sun-protectant products, hair conditioners, lengthening agents and fixatives in perfumes, suspension aids for aluminium salts in anti-perspirant pharmaceuticals, cleaning products, personal care products and animal care products; as disinfectant additives; as degreasing solvents for electronics; as miticides, scabicides, plasticisers and decdorants. The present sequence encodes lemon alcohol acyl transferase, from the present invention. A new DNA sequence encoding a polypeptide with alcohol acyl transferase activity for producing and regulating aromatic and/or aliphatic ester formation in microorganisms, plant cells or plants present invention describes nucleotide sequences with thiolase, Score 14.2; DB 21; Length 1436; Example 5; Page 114-115; 163pp; English. 6 12:43:00 2001 83.5%; 76.5%; 1 GAYTTYGGNTGGGGNAA 17 13; Conservative Query Match Best Local Similarity Thu Dec 6 Matches AAC64787 q ô

The present invention describes nucleotide sequences with thiolase, alcohol acyl transferase, alcohol dehydrogenase, pyruvate decarboxylase, alcohol acyl transferase, alcohol dehydrogenase, pyruvate decarboxylase, anicohortansferase and esterase activities, which are involved in the biosynthetic pathway for aliphatic and/or aromatic ester production in fruit. The nucleotide sequences can be inserted into the genome of a fruit. The nucleotide sequences can be inserted into the genome of a formation. Aromatic and/or aliphatic esters in microorganism, plant cells or plants are produced by inserting thiolase, alcohol acyl minotransferase, alcohol dehydrogenase, pyruvate decarboxylase, aninotransferase and esterase nucleotide sequences into the genome and feeding the microorganism or plant with alcohol, aldehydes, alpha-keto aciditives to enhance the flavour of syrups, ice-creams, frozen desserts, cadditives to enhance the flavour of syrups, lee-creams, frozen desserts, or additives to enhance the flavour of syrups, lee-creams, frozen desserts, including alcohol; enhance or reduce fruit flavour, aroma, fragrance or scent; enhance the flavour or aroma of natural, synthetic or artificial products; for the production of novel combinations of artificial geness as antibacterial or anti-fungal agents; as fragrance or perfumes in cosmetics, creams, sun-protectant products, as as suspension and storal aluminum salts in anti-fungal agents in perfumes, suspension and along and animal care products, as a series of a products. insect pheromones; and as dye carriers, solvents, insect repellents, mitloides, scabicides, plasticisers and deodorants. ```
Vectors containing DNA fragments encoding proteins of plant origin with aromatic acyl transferaes activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colour tone changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in AAT37308-T37313.
                                                                                                                                                                                                                                         which produce anthocyanin pigments and thus altering colour tone, e.g. of flowers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Aromatic acyl transferase; transformation; anthocyanin pigment; plants; acylatton; colour; tone; colouration; colour change; Gentiana triflora; Petunia, hybrida; Perilla ocimoides; Scenecio cruentus; Lavandula angustifolia; ds.

Vectors containing DNA fragments encoding proteins of plant origin with aromatic acyl transferase activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colour tone changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in AAT31308-T37313. NOTE: This sequence is supposed to cross reference with the protein described in AAW04727, however there are so many discrepancies between the polypeptide decoded from this sequence and the polypeptide given in the specification and described in AAW04727 that the indexer decided not to cross reference the two.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cDNA related with fruit ripening - can be used to genetically modify

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        with aromatic acyl transferase activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colour tone changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in AAT37308-T37313.
                                                                                                                                                                                                                                                                                                                DNA coding for aromatic acyl transferase - for transforming plants which produce anthocyanin pigments and thus altering colour tone, e.g. of flowers

                                                                                                                                                                                                                                                                D
                                                                                                                                                                                                                                     ö
                                                                      novel ripening-related product from Cucumis melo. It is one of two specified sequences (MEL2) 1526 bp or (MEL7) 686 bp which were 1solated from a melon ripe fruit cDNA library. MEL2 is not a full-length clone; it lacks the initiation codon for the amino terminus. The cDNA allows control of the ripening of fruit, especially melons.
                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Anther specific cDNA or genomic sequences can be used to identify and isolate anther specific promoters. The anther specific promoter can then be cloned into a recombinant construct and used to express heterologous genes. Preferred heterologous genes include Diptheria toxin A-chain gene; pectate lyase gene pelE from Erwinia chrysanthemi; T-urfil from cms-T maize mitochondrial genomes; the Gin recombinase gene from phage Mu; the indole acetic acid-lysine

Gaps
synthetase gene from Pseudomonas syringae and the CytA toxin gene from Bacillus thuringiensis Israeliensis. All of these genes when expressed in anther tissue will result in the lability of the plant to produce viable pollen. Transformation of plants with such a recombinant construct can produce transgenic, male sterile plants. Male sterility is important in the production of hybrid seeds as it prevents self pollination which hinders breeding and hybrid seed
                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                   /note-Tvector: lambda Z1p-Lox; Site_1: Sal; Site_2: Not; Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark-rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and saliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Email: estewatson.wustl.edu

/
from root tissue of 2 week old seedlings for PI468916. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a KhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by KhoI digestion. The cDNA fragments were directionally cloned into the EcoRI. KhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (Gibco BRL). This library was constructed in the laboratory of Dr. Randy Shoemaker at Iowa state university."

The library was prepared using the Life Technologies propersoript conn library construction kit. Complementary DNA was synthesized from mRNA using a poly(df) sequence with a Not I restriction site. Sal I linker adapters were ligated to the blunt-ended cDNA fragments followed by Not I digestion. The cDNA fragments were directionally cloned into the Not I-Sal I restriction

Complementary DNA was synthesized from mRNA using a 3' anchored poly (dT) primer. ECORI adapters were ligated to the blunt-ended cDNA fragments followed by digestion with ECORI and HindIII. The cDNA fragments were directionally cloned into the ECORI-HindIII restriction site of the pT7T3-Pac vector. The ligated cDNA fragments
                                                                                                                                                                                                                                                                                                       ö
site of the pSPORII vector. The ligated cDNA fragments were transformed into E.coli Electromax DH10B host cells. This library was constructed by Dr. Paul Keim and Dr. Virginia Coryell."

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil4732114[gb]AR129072.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and
